

1. (3 p.) The STFT (instantaneous spectrum)  $X(e^{j\theta}, n)$  of the signal  $x(n)$  (see plot)

is computed using rectangular window  $g(k)$  of length  $K = 7$ .

- For  $n$  given below, sketch  $|X(e^{j\theta}, n)|$  for all  $\theta$ ;  
 then calculate numerical values of  $X(e^{j\theta}, n)$  at  $\theta = 0, \pi/2$  and  $\pi$ :

(a)  $n = -3$ .  $\rightarrow 2\text{zero}$   
 (b)  $n = 0$ .  $\rightarrow \delta(n+2) + \delta(n-1) \rightarrow e^{j2\theta} + e^{-j\theta} = (e^{j\theta/2} + e^{-j\theta/2}) \cdot e^{j3\theta/2}$   
 (c)  $n = +3$ .  $\rightarrow \delta(n+2) + \delta(n+1) + 0 + \delta(n-1) + \delta(n-2) \rightarrow 2\cos 2\theta + 2\cos \theta$

hint 1: Use the above plot to mark three positions of window.

hint 2: In one case you will look for a Fourier transform of a sum of rectangle and delta.

2. (5 p.) Analyze a filter described with the following graph:

$R(z) = aX(z) + aR(z)z^{-1} \Rightarrow X(z) = \frac{1 - az^{-1}}{a} R(z); Y(z) = bR(z) + z^{-2}R(z)$

Assume  $a = +9/10, b = -10/9$

$H(z) = \frac{Y(z)}{X(z)} = \frac{a(b + z^{-2})}{1 - az^{-1}} = \frac{1 - 0.9z^{-2}}{1 - 0.9z^{-1}}$

- Find  $H(z), h(n)$ .  
 Hint: you may use  $r(n)$  as a "helper" when writing the difference equation.
- Find zeros/poles and plot their location on  $z$ -plane. Check if the filter is stable
- Sketch approximate  $A(\theta)$
- Calculate response  $y(n)$  for  $x(n) = 3 + \sin(n\pi/2)$

3. (2 p.) Calculate the z-transform and determine ROC (region of convergence) for the series:

- $\delta[n+20] \rightarrow z^{20}, \text{ everywhere } < \infty$
- $\delta[n-1] - \delta[n+1] \rightarrow z^{-1} + z, \text{ everywhere } < \infty$
- $u[n] \cdot (-1)^{n-2} \rightarrow \frac{1}{1+z}, |z| < 1$

$\theta = 0 \rightarrow H(\theta) = \frac{0.1}{0.1} = 1$   
 $\theta = \pi/2 \rightarrow H(\theta) = \frac{1.9}{1 - 0.9j}$

4. (3 p.) A certain filter has frequency response

$H(\theta) = \begin{cases} 1 & \text{for } -\pi/3 < \theta < \pi/3 \\ 0 & \text{otherwise} \end{cases}$

$\rightarrow \text{phase} = 0, \text{ so } h(n) \text{ symmetric}$   
 $\Rightarrow \text{non causal !!!}$

- Is the filter causal? If yes: find the group delay of the filter. If no: how to make it a causal FIR?
- Calculate  $h(n)$  (find equation).
- Calculate values of  $h(0), h(1), h(-1), h(3)$

$\Sigma = 13p T = 75 \text{ min}$

cut and shift

4 b)  $\frac{1}{2\pi} \int_{-\pi/3}^{\pi/3} e^{jn\theta} d\theta = \frac{1}{2\pi} \cdot \frac{1}{jn} e^{jn\theta} \Big|_{-\pi/3}^{\pi/3} = \frac{1}{2\pi jn} \cdot 2j \sin n\pi/3 = \frac{\sin n\pi/3}{n\pi}$   
 $h(0) = 1/3; h(1) = h(-1) = \frac{\sin \pi/3}{\pi}; h(3) = 0$
